Onice Action Summary		Examiner	Art Unit						
		Joe Logsdon	2662						
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply									
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). - Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status									
1)	Responsive to communication(s) filed on	· ·							
2a) <u></u> ☐	This action is FINAL . 2b)⊠ Th	is action is non-final.							
3)□	Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under <i>Ex parte Quayle</i> , 1935 C.D. 11, 453 O.G. 213.								
Disposition of Claims									
4)⊠ Claim(s) <u>1-22</u> is/are pending in the application.									
4a) Of the above claim(s) is/are withdrawn from consideration.									
5)	5) Claim(s) is/are allowed.								
6)⊠	6)⊠ Claim(s) <u>1-22</u> is/are rejected.								
7)	7) Claim(s) is/are objected to.								
8) Claims are subject to restriction and/or election requirement.

Art Unit: 2662

Claim Rejections—35 U.S.C. 112, First Paragraph:

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 1-22 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Claims 1, 5, 6, 11, 16, and 20 use the term "time slot." The specification fails to define "time slot" as it relates to the claimed invention. For example, consider Fig. 7, which is discussed on pages 12 and 13 of the specification. In Fig. 7, it is stated in parentheses, "One time slot at a time." The significance, and indeed meaning, of "time slot" is unclear; one may guess that 32 bits arrive in each "time slot" or that 32 bytes arrive in each "time slot." In this case perhaps 32 multiplexers are active in each of the 24 time slots; in the former case each multiplexer selects one bit per time slot, and in the latter case each multiplexer selects a string of 8 bits per time slot. One may instead guess that only one bit arrives in each "time slot" on the 32-bit bus. In this case perhaps only one multiplexer is active in each time slot. One of ordinary skill in the art would have no way of determining the number of time slots that are being used for any specific embodiment. The specification therefore fails to enable one of ordinary skill in the art to make or use the invention as claimed.

Art Unit: 2662

Furthermore, the apparatus and its method of use, as described in claims 1, 5, 6, 11, 16, and 20, is sufficiently complex that a reasonably detailed description, including a set of detailed drawings, is necessary to enable one of ordinary skill in the art to make or use the invention as claimed. According to Van Hoogenbemt, the selector circuitry is very complex (column 1, lines 21-25; column 1, lines 35-40). The selector circuitry depicted as 701 in Fig. 7 lacks enabling detail because it fails to teach a design of the selector that would allow the selector to perform its intended function. As described on pages 5 and 6 of the specification, the figures only provide functional level block diagrams of the claimed invention. The specification therefore fails to enable one of ordinary skill in the art to make or use the invention as claimed.

Claims 2-4, 7-10, 12-15, 17-19, 21, and 22 depend on claims 1, 5, 6, 11, 16, and 20 and are therefore similarly rejected.

Furthermore, claims 7, 8, 12, and 13 describe "bit maps." Although the specification states, on page 11, lines 22-27, that input and output data bits can be represented by a matrix referred to as a bit map, as depicted in Fig. 6, the specification nowhere offers a physical embodiment for the bit maps. The specification provides no working example and no explanation that might enable one of ordinary skill in the art to make or use the invention as claimed.

Claim Rejections—35 U.S.C. 102(b):

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

Art Unit: 2662

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-5 are rejected under 35 U.S.C. 102(b) as being anticipated by Tocci. Tocci teaches a demultiplexer, which corresponds to the case where N=T=M=T2, R2=4, and R=1 (pages 388-394). As defined in the specification, "rails" in the claims can be "lines" as used in Tocci. There is one input, *Z*, so R=1 (Fig. 9.33 on page 393). An example is depicted in which 16 input positions (N=16), corresponding to 16 time slots (T=16), are switched to 16 output positions (M=16) (A₀-A₃, B₀-B₃, C₀-C₃, and D₀-D₃) arranged as 16 time slots (T2=16) on 4 rails (R2=4) (O₀-O₃) (Fig. 9.33 on page 393). Input data are arranged as bit packs, which can be bits according to the specification, in 16 time slots on 1 rail; data from the rail are selected and sent to the output (pages 391-394). The output has 16 positions and 4 rails (Fig. 9.32; Fig. 9.33; pages 392-393).

Claim Rejections—35 U.S.C. 103(a):

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various

Art Unit: 2662

claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

7. Claims 6, 11, and 16-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Hoogenbemt.

With regard to claims 6 and 20-22, Van Hoogenbemt discloses an interfacing device that extracts M outgoing sets of bits (bit packs) out of N incoming sets of bits (abstract). According to one embodiment there are M multiplexers in the interfacing device; each multiplexer (a selection block) selects one of its N-M+1 inputs to place at the output (column 2, lines 37-45). Although Van Hoogenbemt does not explicitly state the number of time slots or the number of input or output rails, the interfacing device inherently uses some number, T, of time slots for the input; some number, T2, of time slots for the output; some number, R, of input rails; and some number, R2, of output rails. Van Hoogenbemt fails to teach that the number of inputs to each multiplexer is the same as the number of input rails. It would have been obvious to one of ordinary skill in the art to modify the invention of Van Hoogenbemt so that the number of inputs to each multiplexer is the same as the number of input rails because through appropriate modification of the selection inputs to the multiplexers any combination of inputs could be output from the set of multiplexers, and any change in strategy could easily be implemented through modification of software that controls the selection inputs.

Art Unit: 2662

With regard to claims 11 and 16-19, Van Hoogenbemt discloses an interfacing device that extracts M outgoing sets of bits (bit packs) out of N incoming sets of bits (abstract). According to one embodiment there are M multiplexers in the interfacing device; each multiplexer (a selection block) selects one of its N-M+1 inputs to place at the output (column 2, lines 37-45). Although Van Hoogenbemt does not explicitly state the number of time slots or the number of input or output rails, the interfacing device inherently uses some number, T, of time slots for the input; some number, T2, of time slots for the output; some number, R, of input rails; and some number, R2, of output rails. Van Hoogenbemt fails to teach that the number of inputs to each multiplexer is the same as the number of input positions and that the number of multiplexers is the same as the number of output data rails. It would have been obvious to one of ordinary skill in the art to modify the invention of Van Hoogenbemt so that the number of inputs to each multiplexer is the same as the number of input positions to the interface device, and the number of multiplexers is the same as the number of output data rails, because through appropriate modification of the selection inputs to the multiplexers any combination of inputs could be output from the set of multiplexers, and any change in strategy could easily be implemented through modification of software that controls the selection inputs.

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Sanders, Chen et al., Gorshe et al., and Rostoker et al. are cited to show the state of the art.

Art Unit: 2662

Conclusion

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Joseph Logsdon whose telephone number is (703) 305-2419. The examiner can normally be reached on Monday through Friday from 8:00 am to 4:30 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Hassan Kizou, can be reached at (703) 305-4744.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-4700.

10. Any response to this action should be mailed to:

Commissioner of Patents and Trademarks

Washington, D.C. 20231

Or faxed to:

(703) 308-6743

For informal or draft communications, please label "PROPOSED" or "DRAFT".

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA, Sixth Floor (Receptionist).
